

```
CREATE TRIGGER trg_EmployeeInsert
ON employee
FOR INSERT
AS
BEGIN
    INSERT INTO AuditLog (employee_id, Action)
    SELECT emp_id, 'Employee Created'
    FROM inserted;
END;
```

EXPLANATION:

1. **ON employee** - Specifies the table the trigger is attached to
2. **FOR INSERT** - Fires the trigger after an INSERT operation
3. **INSERTED** - A special virtual table that contains the new rows being inserted
4. **SELECT emp_id, 'Employee Created'** - For each inserted row, logs the employee ID with the action description

HOW TO TEST IT:

sql

```
-- Insert a new employee
INSERT INTO employee (emp_id, name, dept, salary)
VALUES (1, 'John Doe', 'IT', 75000);

-- Check the AuditLog table
SELECT * FROM AuditLog;
```

Result:

employee_ id	Action
1	Employee Created

IMPORTANT NOTES:

- The trigger handles multiple row inserts (batch inserts) by using `SELECT` from the `INSERTED` table
- If you need to log the current timestamp as well, you can add a `DateTime` column to `AuditLog` and use `GETDATE()` in the INSERT statement
