

View vs. Table: A table physically stores data on disk, while a view is a virtual table based on a SQL query that dynamically displays data from one or more tables. Views do not hold data themselves; they just present it.

View & Types: A view is a saved SQL query that acts like a table. Types: Simple View (based on one table, no functions/groups, allows DML) and Complex View (based on multiple tables, includes functions/groups, does not allow DML).

Simple vs Complex View: Simple views use one table and basic columns (e.g., `CREATE VIEW emp_view AS SELECT name, salary FROM employees;`). Complex views use multiple tables, joins, functions, or groups (e.g., `CREATE VIEW dept_summary AS SELECT d.dept, AVG(e.salary) FROM emp e JOIN dept d ON e.dept_id=d.id GROUP BY d.dept;`).
