

// Given class and interfaces

```
class Vehicle {  
    String brand;  
  
    void fuel() {  
        System.out.println("Vehicle needs fuel");  
    }  
}
```

```
interface Movable {  
    void move();  
}
```

```
interface Flyable {  
    void fly();  
}
```

// Aeroplane class inheriting Vehicle and implementing Movable & Flyable
class Aeroplane extends Vehicle implements Movable, Flyable {

```
    @Override  
    public void move() {  
        System.out.println("Aeroplane moves on runway before takeoff");  
    }
```

```
    @Override  
    public void fly() {  
        System.out.println("Aeroplane flies in the air");  
    }
```

```
    void displayBrand() {  
        System.out.println("Brand: " + brand);  
    }  
}
```

// Usage example

```
public class Main {  
    public static void main(String[] args) {  
        Aeroplane airbus = new Aeroplane();  
        airbus.brand = "Airbus";  
        airbus.displayBrand(); // From Vehicle class  
        airbus.fuel();         // From Vehicle class  
        airbus.move();         // From Movable interface  
        airbus.fly();          // From Flyable interface  
    }  
}
```
