

SQL (Structured Query Language) is a standard programming language used to manage and manipulate relational databases, allowing users to query, insert, update, and delete data.

Data refers to raw, unprocessed facts and figures (e.g., 100, “John”), while **Information** is data that has been processed, organized, and given context to make it meaningful (e.g., “John is 100 years old”).

A **Database** is an organized collection of structured data stored electronically, while a **DBMS** (Database Management System) is software that creates, manages, and interacts with databases.

A **Relational Database Management System (RDBMS)** is a type of DBMS that stores data in tables (relations) with rows and columns, and uses SQL to enforce relationships between tables via keys.

Five DBMS/software names: **MySQL**, **PostgreSQL**, **Microsoft SQL Server**, **Oracle Database**, and **SQLite**.
